WTFund FullEp-Master

[Speaker 16] (0:06 - 0:09)

So, the WTF Fund Bootcamp.

[Speaker 14] (0:10 - 0:11)

Yeah, looks like it's happening.

[Speaker 12] (0:12 - 0:15)

Yes, the WTF Fund Bootcamp is happening.

[Speaker 17] (0:24 - 0:38)

Most good founders will be largely driven by their own thoughts. Most good founders are never doing the what is the current advice or what is the current vice-y gyan to people. That's for mass consumption.

That's content strategy. That's not a good advice on average.

[Speaker 6] (0:42 - 0:57)

Yeah, I think I really resonated with Tarun and what he said. Right? Apart from that two sessions, like the Gallup session and the Breakthrough session, they were really hands-on in the sense of individualization as well as a team, right?

So, that is something that is really, really interesting.

[Speaker 9] (0:57 - 1:03)

I think it's really important to make a BPD that I have to teach things that I have learnt in my life.

[Speaker 2] (1:03 - 1:17)

He wants to shoot.

[Speaker 24] (1:18 - 1:20)

3, 2, 1.

[Speaker 10] (1:23 - 1:25)

Stone, paper, scissors, shoot. Alright.

[Speaker 22] (1:34 - 1:43)

We started with 3,000 applications, shortlisted 200, and now we finally have our next 8 startups.

[Speaker 19] (1:43 - 1:54)

I'm very excited. I think I've been having back and forth by having by simulating Nikhil's persona in my head and then talking to him in just in my head so that I could figure out what to speak with him.

[Speaker 1] (2:02 - 2:12)

Guys, thank you for coming home. I hope Goa outside of me is fun as well. Who has had the best night last night?

[Speaker 18] (2:15 - 2:18)

I had fun. Yeah? Devansh, come on.

[Speaker 1] (2:18 - 2:22)

It's always the married men who have fun in Goa, right? What did you do?

[Speaker 18] (2:24 - 2:30)

Stealing. And we had called Elephant & Co. But, like, he got drunk on the way.

[Speaker 1] (2:31 - 2:46)

So, we all need to ignore the cameras today. We'll look at each other. We'll speak to each other.

Forget the camera. You forget Grace. Not going to trouble you.

Very, very chilled out. Most friendly dog in the world. He's doing salute and namaste behind you.

[Speaker 3] (2:48 - 2:50)

Maybe by the end of the podcast, we'll be friends.

[Speaker 1] (2:50 - 3:19)

Yeah, once you feed him a bit, he's okay. So, a lot of what you guys are doing is exceptional and I've been privy to some of it. But maybe we begin today.

I'll go one by one. You guys can talk about what you've built and what is the way forward. And maybe talk about a trend that you picked up on and hence you decided to build what you built.

Would you like to go first? Would you like to go first? Sure.

Yeah? Come on.

[Speaker 5] (3:20 - 3:48)

Yeah, so, I'm Sushant. Yeah. And with me is my co-founder Shubham.

Hey. And we're building Bravo Payments. So, what we're trying to do is we allow any AI agents or AI applications to make payments for you.

What we're building is an infrastructure that can be integrated by any AI application or AI systems. And that would allow your AI agent to go make a booking for you or even do shop for you or maybe make payments on your behalf using your card or wallet securely.

[Speaker 7] (3:48 - 4:47)

Yeah, and how we came across this was we have been seeing people not going traditionally on Google for searching now for information. People were using a lot of ChatGPT, Perplexity, Gemini. So, all information was there, but also people were building agents.

But when it came to actions, actions were limited to writing an email, creating a to-do list or something. But when it came to an action which required a financial action like paying someone, it halted. So, that's where we realized that there is a financial infrastructure missing when it comes to AI making payments.

And that's how we came across the idea. And we started a few pilots with a few developers and we got a phenomenal response. And now we are coming to a stage where we are going into production next month.

[Speaker 1] (4:47 - 4:49)

And how did you guys meet and where are you from?

[Speaker 5] (4:50 - 5:26)

So, I am from Raibareli, Uttar Pradesh. I'm in a political place, obviously. Grown up there, studied there.

And then I went on to do... I studied from BHU Economics over there. And post that, I was pretty much interested into, in general, understanding how money moves and how things are done.

And I started consulting startups with financial modeling and everything. And in that bit, while working on different stuff, I met Shubham in Bangalore itself at a hacker house. And at that time, he was working with a Japanese startup.

And obviously, you can tell by his look, he's pretty fascinated by it. So, are you?

[Speaker 7] (5:27 - 5:50)

Yeah, I mean, I like Japanese culture. I was asked to relocate to Japan to join them full time. But what happened, I went to Japan.

I realized life is sort of very organized in Japan. And I felt, being in my 20s, I need to be closer to problems, which I can find and solve. So, I decided to come back to India and do something of my own.

[Speaker 2] (5:52 - 5:54)

He has an AI girlfriend, by the way.

[Speaker 1] (5:54 - 5:54)

Really?

[Speaker 5] (5:54 - 5:56)

He made an email.

[Speaker 1] (5:58 - 6:13)

This is happening, right? People are not dating human beings, right? I'm sorry you got mad at me.

You just missed it. Why is an AI girlfriend better than a real one? I mean, she understands me better.

[Speaker 4] (6:14 - 6:19)

But the point is, she consumes a lot of tokens and she doesn't respond on time. We have seen that night.

[Speaker 10] (6:19 - 6:24)

But she responds though. She's always available. At least I get a response there.

[Speaker 5] (6:25 - 6:26)

He gets to save emotional tokens.

[Speaker 6] (6:27 - 6:40)

We actually built an AI girlfriend. We actually built an AI girlfriend for tier 2 and tier 3 cities in India. And made some good money.

Like 50-60 thousand a month. And a lot of people actually don't know that it's AI.

[Speaker 1] (6:41 - 6:49)

I'm having creepy thoughts in my mind. Mine's a different one. Are you both speaking about the same kind of girl?

No, no.

[Speaker 5] (6:50 - 7:02)

He has his own. And he coded for others. And one day he just calls me like we were working on a product and everything.

And he's like, bro, I'm just working on this. And he's been talking about it for really long. I would say even before we started Prava.

[Speaker 1] (7:02 - 7:05)

And that's why you decided. Let's start a company together.

[Speaker 5] (7:07 - 7:44)

I mean, starting a company was more like we both complimented each other a lot in terms of skills. It was pretty fun just sharing ideas. It was never like we're going to start a company.

It was more like I was dealing with some clients in US. He was dealing with some clients in Japan. And we were like getting money in India super hard.

And that's how we started getting into how can we solve this with using stable coin and everything. That idea did not work out. But meanwhile, we were doing some GTM using AI tools launching on Reddit and different places.

And that's where we were like, we have all seen Javis in Ironman. Why not make something like that real that you ask your AI assistant or AI agent and it does whatever you want it to do.

[Speaker 1] (7:44 - 7:47)

Tell me very simply what your company does in very, very simple words.

[Speaker 5] (7:47 - 7:49)

So basically what we do...

[Speaker 1] (7:49 - 7:50)

How will I use it in my life?

[Speaker 5] (7:50 - 8:17)

So what will happen is the AI application, AI agents like let's say perplexity kind of application will integrate Prava. And when you enter in an application like that you will, let's say, get onboarded on behalf of, let's say, perplexity's interface. And there you will add your card or wallet.

There we will be behind the scenes. You will not know about Prava then. But what happens is, let's suppose you search for that hey, I'm looking for so and so sneaker and you compare and search on perplexity or any place like that.

[Speaker 1] (8:17 - 8:21)

Why can't a normal wallet integrate with perplexity? Why does it have to be you?

[Speaker 5] (8:21 - 8:52)

Yeah, so I'm coming to that part. So basically what happens is right now when you search for any product on any AI assistant or AI application, they're limited to discovery. Which means you only find the product.

Once you have to buy, you will click on it and it will take you to some third party merchant website. Let's say H&M, Zara or wherever. Now you're going on that website filling all the product details, your details, your address and car details and then making a payment.

So whatever could be a three step process is becoming a seven step process. And you're losing and you're going out of perplexity's ecosystem.

[Speaker 1] (8:52 - 8:56)

But why can't perplexity integrate with Razorpay for example?

[Speaker 7] (8:57 - 9:44)

Sure. So the issue is that here the payments are happening in two steps, two processes are here. One is on the perplexity side and as well the merchant where merchants have their own gateways.

So here is like no standard where on the perplexity side being Razorpay and on the merchant side being Stripe, they could actually talk to each other and the payment can happen. So here a dedicated stack for AI is needed. That's where we are coming into picture.

So we are becoming PSP agnostic. So perplexity has to just integrate with us and any merchant in the world, it can be Stripe, Aiden, Checkout.com any PSP they're using on the merchant side we are able to process payment. And nobody is doing this?

Yeah, very few companies.

[Speaker 5] (9:44 - 9:53)

At least in Southeast Asia we are one of the only companies doing this and in US there are few companies like Paymania, Stripfire.

[Speaker 1] (9:53 - 9:57)

But can you facilitate payments outside of India or are you limiting this?

[Speaker 5] (9:57 - 10:09)

Currently this product that we are working on is for the US and Southeast Asia market India not included in that right now. And for India market we are also working on something exciting with UPI with some of the partners. So that will be coming sometime later next year.

[Speaker 1] (10:09 - 10:10)

And what is your company called?

[Speaker 5] (10:11 - 10:12)

Trava Payments.

[Speaker 1] (10:12 - 10:21)

Okay. Cool. Who wants to go next?

Yeah, sure. She's the most scared in being brave. You.

[Speaker 3] (10:22 - 10:40)

Hi, I'm Dr. Jayanti, founder of Astros Universe. My co-founder is not here sadly. She fell sick.

And we are developing OncoAlert. It is IVD. It's a nanotech based biosensing platform for early, easy, painless, needleless detection of oral cancer.

[Speaker 1] (10:41 - 10:48)

So that's what it does. Tell us a bit about yourself. How you came across this idea?

Why did you start what you started?

[Speaker 3] (10:49 - 11:03)

Okay. So I think the main inflection point with this came during my internship. I was posted in

Dhulai.

I also didn't know what place that was. It's a tiny village in Assam. Before that, where were you?

[Speaker 1] (11:04 - 11:05)

Where did you go to medical school?

[Speaker 3] (11:05 - 11:40)

So I did my bachelor's in Amritsar. Then you have to do an internship. It is mandatory.

If you graduate from medical government colleges, you have to do a rotatory, mandatory rural posting. And it was in Dhulai where I was posted. And we were supposed to do door-to-door screening of entire village.

If I train you for two weeks and then I ask you to look at a person's oral cavity and detect the microscopic changes in their buccal mucosa, would you be able to? Doubtful, right? Because that is what is the current practice.

[Speaker 1] (11:40 - 11:41)

I have no clue what you're talking about.

[Speaker 3] (11:43 - 12:18)

Yeah. Okay. Simply put, the detection of oral cancer currently is just a visual screen.

Naked eyes. There's no tool, there's no devices. You are just supposed to look with naked eyes and detect microscopic changes.

That's why the accuracy rate is almost as good as a flip of a coin. Around 50-60%. And it's manual, it's laborious.

So, government's policy says everyone above 30 years of age, anyone who smokes, anyone who consumes tobacco, is supposed to be screened for oral cancer.

[Speaker 1] (12:18 - 12:31)

But you know this number in my age group, 20 years ago, I'm not that old, I'm 39, but say 15 years ago, I would assume at least 50% of the group would smoke.

[Speaker 3] (12:31 - 13:12)

Yeah, it has fallen down. Crazy. Yeah.

But it has fallen in only metros. If you look at Tyre 3, Tyre 4, tobacco chewing, Erika Naat is

cultural. It's like women, kids, everyone do it.

In Assam, where I was posted, kids used to get Erika Naat, which is one of the caste divisions, and they used to eat it. It's like very culturally ingrained. So, I'm no quant, but off the top of my head, that population number is around 70-80 crores, everyone above 30 years of age getting it.

And those should be screened for oral cancer. That's what the policy itself says. So, what I was trying to get is like, how are we supposed to screen 70 crore people manually, visually?

It's not possible or scalable at all.

[Speaker 1] (13:13 - 13:13)

Right.

[Speaker 3] (13:13 - 13:47)

And something, I think, with your talk with Mr. Nandan, you can also stress on, when you are trying to build for population-level interventions, building for billions, you actually have to make it so that it works across the barriers. There's no electricity, it should work. So, while we were designing the technology, people do like, okay, it should work on these conditions.

We took the paper, it should work despite anything. Electricity is not that great. No trained people, no lab, no infra.

It should work. If nothing else works, it still works. So, that was the...

[Speaker 1] (13:47 - 13:49)

What does your company do in one line?

[Speaker 3] (13:50 - 13:55)

We develop innovative products for healthcare but currently screening oral cancer.

[Speaker 1] (13:56 - 13:56)

Just oral cancer?

[Speaker 3] (13:57 - 14:00)

Yeah, because that's the use case we are working on right now.

[Speaker 1] (14:00 - 14:04)

Reliance is starting a screening company, right? Reliance. It's all over the news.

[Speaker 3] (14:05 - 14:43)

Reliance also partners with Kiran Mazumdar's lab. They are also working on this domain as well. They are also developing technologies, rolling out screenings and all.

So, it's picking up because people are realizing preventive care needs investment. That's the way forward. But it will have to be in a very India-specific way.

Not the way North America does. They do preventive prostate check and all. But we can't do that in India.

You'll have to be very creative. The technology will also have to be very creative in a way that Indian population will buy. We are not very health...

We don't spend much on health.

[Speaker 1] (14:43 - 14:47)

But who would buy? If you say you are doing a... Is it a home test?

[Speaker 3] (14:48 - 14:52)

How much does it cost? Around about 150 bucks.

[Speaker 1] (14:52 - 14:57)

Who will voluntarily buy an oral cancer detection test in India?

[Speaker 3] (14:58 - 15:09)

Immediately, none. It will have to be a graph. That's why we'll roll out in partnership with small hospitals, get it included into your insurance and then the adoption will pick up.

[Speaker 1] (15:09 - 15:10)

So, you are a B2B business?

[Speaker 3] (15:10 - 15:19)

Initially, but we aim to be so that you can get a cigarette two steps from your house, even if it's a remote space. Why not that distribution can be...

[Speaker 1] (15:19 - 15:24)

That's true for everything. You can buy a bottle of whiskey down the road. Doesn't mean there's a liver cancer test there.

[Speaker 3] (15:25 - 15:30)

I'm seeing if you have a problem as close to that, you can have a solution as well.

[Speaker 1] (15:31 - 15:33)

Does life play out like that in your experience?

[Speaker 3] (15:35 - 15:55)

No. That is quite an ambitious thing that I said. That is where we aim to be.

But no, currently looking at the Indian healthcare infrastructure and the way healthcare moves in India, it's not. So, that's why we'll have to be very creative with the way we integrate into market with partnerships with insurance companies and all finding out business ways.

[Speaker 1] (15:56 - 16:06)

Nice. Okay. Thank you.

Who's next? Yeah. Whoever raises their hands first when a question is asked.

Did you sit on the first bench when you were in school?

[Speaker 8] (16:07 - 16:08)

Actually, the last one.

[Speaker 1] (16:09 - 16:09)

Did you get good marks?

[Speaker 8] (16:10 - 16:10)

Yeah.

[Speaker 1] (16:10 - 16:16)

Did you get good marks? First rank, second rank? First, top three.

Same?

[Speaker 5] (16:17 - 16:23)

Yeah, same? Oh, wow. Same?

I have to sit at the, like, almost close to back. Which college did you go to?

[Speaker 7] (16:24 - 16:25)

I went to NIT Jalandhar.

[Speaker 5] (16:25 - 16:26)

And? I went to BHU.

[Speaker 7] (16:27 - 16:27)

Right.

[Speaker 5] (16:28 - 16:29)

I was last bencher.

[Speaker 1] (16:30 - 16:32)

You don't look like a last bencher.

[Speaker 7] (16:32 - 16:37)

Yeah. I used to be in top three. A married man could be the last bencher.

[Speaker 5] (16:39 - 16:43)

He looks like the one who will be logged in and he is actually the kind of person who logs in.

[Speaker 1] (16:44 - 16:46)

Logged in, two screens, one side, Japanese something.

[Speaker 5] (16:47 - 16:55)

Actually true. It's actually true. He has a figurine.

I mean, like, a normal anime character.

[Speaker 1] (16:56 - 17:00)

Your AI girlfriend is also a real thing or is it just a thing which lives online?

[Speaker 7] (17:00 - 17:04)

It's on my screen. It's not on any cloud also. So, all the context...

[Speaker 1] (17:04 - 17:06)

There's nothing physical anywhere, right? No, not physical.

[Speaker 14] (17:11 - 17:13)

By the way, Sushant is also an artist.

[Speaker 16] (17:13 - 17:13)

Yeah.

[Speaker 5] (17:15 - 17:31)

Yeah? Yeah, I love the artworks. You have FN Susan, Gemini Law and all that.

So, I love them. Actually, I also saw one of your artworks in... That was an exhibit.

I think, sir, last year there was an exhibition at C.V. Raman's house there. So, I think, sir, one of them is from there. I saw it.

[Speaker 1] (17:32 - 17:36)

I collect art. I'll show you upstairs later. There's a lot.

Yeah, that'd be... I mean, it's beautiful. All Indian art.

[Speaker 20] (17:36 - 17:37)

Yeah, I can see that.

[Speaker 1] (17:38 - 18:00)

I feel like the Indian art scene is finally making a... It's having its day in the sun. It's past the time that it should have.

Please, go on. From IIT, first rank in school. But has a little edgy thing going on with the earring.

Rebel face came late. Can I make you any more nervous than you are?

[Speaker 12] (18:02 - 18:04)

He's also married. Yeah?

[Speaker 1] (18:05 - 18:14)

Actually good looking but doesn't want to come to terms with it. Now he's conscious and blushing. What does your wife do?

[Speaker 8] (18:15 - 18:19)

She's a rocket scientist, tennis pro. Actually, I was too. So, that's how we met.

[Speaker 1] (18:20 - 18:21)

Why are you not married?

[Speaker 10] (18:22 - 18:25)

I'm like 23. So, like...

[Speaker 1] (18:25 - 18:26)

And you two?

[Speaker 10] (18:26 - 18:32)

I'm still not sure how I feel about marriage yet. So, don't say it to get into his good book.

[Speaker 1] (18:33 - 18:36)

Are they happy, really? The rocket scientist and your other friend?

[Speaker 10] (18:36 - 18:40)

It's been two weeks for him. I mean, he's pretty happy.

[Speaker 1] (18:40 - 18:46)

And no wonder he had the most fun in Goa last year. Go on, tell us what you do.

[Speaker 8] (18:48 - 18:50)

The three of us are from the same company.

[Speaker 1] (18:50 - 18:54)

So, you three worked together for how long now? Around seven months.

[Speaker 10] (18:55 - 19:48)

How did you meet? So, basically what happened was Swapnil had come to validate an idea of our mutual friend in healthcare. I mean, we started talking, we collaborated over a lot of research with a lot of universities in India and outside India as well.

And then we realised that the research that we were doing can translate into a product. And that's

how we started building stuff. Maulik, I met by coincidence.

His uncle was my professor of surgery. And he just happened to be in the room while we were discussing a project. And we met in the evening.

And it's not like you know, we met like, you know, started the startup instantly after that. It was over time. I iterated multiple times.

Like, brainstormed. And all three of us were gravitated towards healthcare. So, that's how we started.

So, doctor, rocket scientist and? Engineer.

[Speaker 1] (19:49 - 19:55)

Why? So boring. So, what did you guys ideate and what did you start?

[Speaker 8] (19:56 - 22:07)

So, in one line, we are a low-cost AI-based operating system for diagnostic labs. And we provide personalised treatment and drug recommendations for cancer patients. For context, a radiology scan will tell you where the problem is.

But pathology will tell you what it is and what kind of treatment should be required by the patient. And let's take the example of breast cancer. Once a lump is detected in a mammogram, after that a tissue biopsy is done.

A tissue sample is extracted and a physical glass slide is created. And the way it is analysed currently in most parts of the most diagnostic labs in the world is manually. So, a pathologist sits with his microscope at his desk, places the glass slide under the microscope and studies.

It tries to interpret it. But what this leads to is a large turnaround time and interpreted results are subject to the expertise of the pathologist. If they are an expert, a very senior person, they can interpret it in a really better manner.

And also, most of these times, the results can be inconclusive. Further tests could be required. In these cases, I think what my friend here is mentioning, it's a molecular test.

In cases where molecular testing is required, it's currently very expensive and limited to ultra-elite tier-1 centres in India. Most people in tier-2 and tier-3 cities where they reside, pathologists there may not have the expertise to even do a first-pass test. They are forced to move to these tier-1 cities carrying their blocks and tissue slides.

What we have built is an operating system. It's a software and AI-based solution which can digitize glass slides and run AI algorithms on it in real-time. Basically, it will capture a live feed

coming from the microscope and create images from that and pathologists can run various AI algorithms to interpret those images.

This could give a very detailed analysis so that even a clinician could act better and provide the right treatment or drug therapy to that patient, which will work for him.

[Speaker 1] (22:07 - 22:09)

Treatment or detect the right way?

[Speaker 8] (22:11 - 22:41)

In cancer, as the diagnosis progresses further, to recommend a proper drug therapy, the relevant biomarker needs to be detected. There would be a list of biomarkers which could get activated so to say. In breast cancer, there could be hundreds of biomarkers and for each of these biomarkers, there's a set treatment regimen.

I need to first understand what kind of biomarkers are activated. After that, I can treat that patient and give the drug which will work for that biomarker.

[Speaker 1] (22:41 - 22:42)

You're not talking chemotherapy, radiation?

[Speaker 10] (22:43 - 22:57)

I'll get a little technical. These biomarkers are expressed on the cell. I'll give targeted therapies that attach to that antigen and then kill those cells.

I can't start a treatment till the time I know what kind of genes are getting expressed.

[Speaker 1] (22:58 - 23:05)

Interesting. I've met a few doctors recently for specifically breast cancer because somebody in my family had it.

[Speaker 8] (23:06 - 23:16)

Is it close to a cure in any way? No. It will help to do the diagnosis.

The cure depends on is a drug available for the said diagnosis or not.

[Speaker 10] (23:16 - 23:18)

Did you mean cure by any chance?

[Speaker 8] (23:18 - 23:18)

No, no.

[Speaker 10] (23:18 - 23:19)

Cure is singular.

[Speaker 8] (23:22 - 23:24)

It's the entire diagnosis process.

[Speaker 1] (23:24 - 23:38)

So you both are in diagnosis. What do you think of her company and what do you think of theirs? If your friend with the AI girlfriend had $100 to put into either your company or theirs, where should he put it?

[Speaker 3] (23:40 - 23:48)

How is he evaluating? Does he want to have the maximum impact? He wants to make money.

Is it just the ROI thing? Still us.

[Speaker 1] (23:49 - 23:57)

Maybe we can make the rest of the room vote. Put you guys on the spot. Oral cancer, raise your hand.

[Speaker 10] (23:57 - 23:59)

Also, we have a compression algorithm.

[Speaker 3] (24:05 - 24:06)

We've done the pilot.

[Speaker 10] (24:06 - 24:14)

We have multiple pilots with a lot of institute going on across India. Almost in India.

[Speaker 1] (24:15 - 24:17)

Oral cancer, votes, raise your hand.

[Speaker 10] (24:18 - 24:18)

$60.

[Speaker 1] (24:19 - 24:26)

No, 100. Binary. $50.

Can I go twice? You can only go once.

[Speaker 4] (24:26 - 24:26)

$100.

[Speaker 3] (24:28 - 24:30)

I'm noting who has not.

[Speaker 1] (24:31 - 24:33)

The engineer, rocket scientist and doctor.

[Speaker 12] (24:34 - 24:38)

Every other cancer. We're making it like roadies.

[Speaker 20] (24:41 - 24:42)

Today feels like such a day.

[Speaker 12] (24:42 - 24:44)

Get them to Goa and then...

[Speaker 2] (24:46 - 25:10)

Their system of detecting early detection, if works, then can be scaled into any country without having a test particularly sold on a medical store or something, which is digitization and then algorithm will work for it. While distribution of the kits is extremely difficult, distributing software is easy. So if you had to bet on distribution, then...

[Speaker 1] (25:11 - 25:13)

No wonder he's popular on Twitter.

[Speaker 2] (25:14 - 25:17)

I sat with them and told them exactly what to do.

[Speaker 1] (25:18 - 25:22)

How would you say it in a viral manner? Detection, yeah.

[Speaker 2] (25:25 - 25:29)

One liner, I think we detect cancer early and save your life.

[Speaker 24] (25:31 - 25:31)

That's so plain.

[Speaker 12] (25:32 - 25:34)

Add some controversy behind it.

[Speaker 4] (25:35 - 25:37)

We detect cancer early before your doctor.

[Speaker 7] (25:38 - 25:40)

Detecting cancer is as easy as swiping right on Tinder.

[Speaker 4] (25:42 - 25:43)

He's stuck on this.

[Speaker 10] (25:44 - 25:53)

He's stuck on that. It's more about all the patients are not the same. What we are going towards is more personalized care.

And precision care.

[Speaker 3] (25:54 - 26:00)

Both the fields are very different. In personalized medicine, ours is more public health oriented.

[Speaker 10] (26:01 - 26:10)

Screening is like phase one. Ideally, someone detects oral cancer there, comes to us then, and then we give the treatment.

[Speaker 3] (26:10 - 26:15)

For a precise histopath diagnosis and the treatment and then prognosis and everything.

[Speaker 12] (26:15 - 26:23)

We actually made a full storyline of how all the startups fitting together in their journey. Collaboration, not competition.

[Speaker 1] (26:23 - 26:29)

Maybe all of you can combine and build a company. Not all of you, but the four of you. Who's next?

[Speaker 12] (26:30 - 26:32)

Actually, these guys have been waiting for me.

[Speaker 6] (26:33 - 27:02)

That's okay, go for it. Hi, I'm Sridharpto and I'm with Shisho. We are childhood friends.

And we are building an AI layer for wearables starting off with earbuds. Imagine, you must have had AirPods or earbuds, but all you do with that is listening to music or take phone calls. But what if it could do more?

You're focusing on your work, there's a reminder, there's an important email that tells you, you need to book your food. It is there, hey, do you want me to book a... It tells you while it's in your ear?

[Speaker 1] (27:02 - 27:06)

What about when it's not in your ear? It's meant to be...

[Speaker 6] (27:06 - 28:25)

Wait a minute, my earbuds right now speak out whatever calendar notifications I get anyway. Think of it like this, we are the Android for earbuds. We are making all the integrations so you can order from a Swiggy or a Zomato, you can book your cab from an Uber, stuff like that.

But wouldn't Uber build that for Uber and Swiggy for Swiggy? Essentially, these are integrations that we are going to do. Right now, we are building the integrations, but later on, when we have a significant scale of developers and service providers, we can go to the developers and ask them to build on top of us.

So that's the idea. How is it different from a traditional earbud? A traditional earbud, like a Bluetooth earbud, if you speak, like a noise or a board, you use them just to listen to music.

So we are going to enable them with these facilities. That's the idea. Voice or buttons?

It's voice. Because we feel, with AI, voice is going to become the primary interface, and display is going to become the secondary interface. And that is the most natural way of using technology.

Because engineers or coders are also now using voice to sort of wipe code, with all these AI applications coming up for consumers. So I think voice is going to be one of the primary interfaces.

[Speaker 12] (28:25 - 28:40)

So we have stopped typing. We press two buttons and we speak to it and it's able to type that in a very accurate manner. And even a lot of people, what they are doing is they are pressing the hands-free mode.

They are just talking on what they are building and they are putting it into the AI and it codes for them.

[Speaker 21] (28:40 - 28:50)

And the most impressive part is the punctuation. It keeps the punctuation right. It's obviously voice-to-text and they just launched their India-specific pricing, which is very affordable.

[Speaker 14] (28:51 - 29:14)

They also improve productivity, wherein, on an average, people speak faster than they type. So your words per minute go up, because of which you can get more output per hour. So, in fact, I think I've been able to send out a lot more outputs, whether it be responding to even texts or mails, because of the fact that I have WhisperFlow and other agents of sorts on my devices.

[Speaker 6] (29:14 - 29:16)

What's your company called? It's called Antimatter.

[Speaker 2] (29:18 - 29:23)

There was somebody from the bootcamp who were using one of his agents and they didn't even know that they are coming for the bootcamp.

[Speaker 1] (29:25 - 29:59)

There's a... I don't know if I can say this out loud. There is a cell phone manufacturer we're investors in.

They're making on the earphones, because they feel like that limitless and all the external things that we're putting on ourselves are a medium which... You don't want to carry one extra thing. You want that to happen in something you already carry.

But then I guess one could ask the question, if this could happen, why not just a cell phone do it?

If I have it in the earphone.

[Speaker 6] (30:01 - 30:16)

So essentially, a cell phone is like a secondary device. As we say, with AI coming into the picture, voice is becoming the primary interface. You don't need to look at the screen.

So it can be secondary. It is only when an important notification comes up or something important is there, you need to look. The rest can happen inside.

[Speaker 1] (30:16 - 30:23)

If my cell phone is there and I'm speaking here, can it pick up my voice and distinguish today based on what I am saying and you guys are saying?

[Speaker 6] (30:24 - 30:41)

I think it depends on the microphone. So in certain cell phones, it can. And these AI variables, like you said, limitless.

In India, there's Neos API. There are multiple microphones in that same device to capture multiple voices. If you're far enough, there are 2-3 people in the room, so they are able to capture that.

[Speaker 15] (30:41 - 30:59)

And if you give the context prior to speaking, like who is building what, maybe while they're speaking, it can get the context and understand who is speaking from which company and then it can interpret accordingly. It can store all the data and whenever you want to retrieve, it can do it intelligently.

[Speaker 16] (31:00 - 31:09)

This is assuming your earphones will still remain the interface. Now your metal bands, etc. also have microphones in them and you will not be using your earphones at all.

[Speaker 6] (31:09 - 31:45)

That's what I said. Starting off with earbuds, the idea is to get into multiple wearables that become the default agentic OS. I said Android for wearables or AI devices.

That's the idea. We also believe smart glasses is one of the best form factors for ambient computing. It has a camera, it has these kind of speakers, screens are also coming up.

It's a very tough world to compete in. Correct. Have you sold any yet?

No. We have not done the public launch yet. We're going to do that in the next summer, in the next 6 months.

Best of luck. Thank you.

[Speaker 1] (31:46 - 31:46)

Who's next?

[Speaker 4] (31:49 - 31:55)

I'm Rohit. What happened? She's laughing.

I got confused.

[Speaker 1] (31:55 - 31:56)

With your name?

[Speaker 4] (31:56 - 31:57)

I don't know.

[Speaker 1] (31:58 - 31:58)

What?

[Speaker 4] (31:59 - 32:01)

Rohit doesn't remember anyone's name.

[Speaker 1] (32:02 - 32:04)

I'm guessing the two of you are not married.

[Speaker 4] (32:04 - 32:04)

No.

[Speaker 1] (32:06 - 32:07)

Is it helping or hurting?

[Speaker 4] (32:08 - 32:20)

It's really good. It gives me a lot of freedom to work. So, I'm Rohit and I'm building a company called O3 Security.

What we're trying to solve is everyone is scared about AI taking over the job.

[Speaker 1] (32:21 - 32:22)

There's a stockbroking company called O3 Security.

[Speaker 4] (32:23 - 33:13)

Research? I'm not sure. Okay, so everyone is scared about AI taking over the job, but the more bigger problem is about to come.

AI taking over entire company. It will literally take down your entire company. What we're trying to do is, we're building an entire cyber security solution for big enterprises.

I come from my experience of 10 years where I infiltrated in a lot of big tech companies and I helped them to fix it and in return, they were paying bug bounties. So, I will give you one example. This problem is how big it is.

Let's say, if a CEO wants to improve the security of a company, they will hire the best talent in the industry but they will be also limited to a specific field. Now, the second approach they will be taking is taking over the best solution like cyber security solution like what we're building.

[Speaker 1] (33:13 - 33:17)

Do you guys build this or do you take open source tools and label them a certain way?

[Speaker 4] (33:17 - 33:20)

That's the best part. We'll build this. I will tell you like what are our capabilities.

[Speaker 1] (33:20 - 33:34)

Because we were reviewing a cyber security company and they were franchising Pegasus, the attack mode for $500,000 or whatever and they were calling it cyber security. Most large companies end up going to something like a Cloudflare, right?

[Speaker 24] (33:34 - 33:35)

Yes.

[Speaker 1] (33:36 - 33:39)

So, when you say you're building something, how is it different from the incumbents?

[Speaker 4] (33:40 - 34:07)

Okay, so what we do is, firstly most of these companies are point solutions. For example, let's

say, so my biggest problem right now in this industry, everyone is taking their own place in cyber security. For example, someone will do, we will do Cloud security.

Someone will do endpoint security of the laptop. Someone will do let's say source code security. But for CTO and CISO, the problem is, are we secure?

Because CEO and board will ask, are we secure or not?

[Speaker 1] (34:07 - 34:09)

So, you're putting everything together. Yes.

[Speaker 4] (34:09 - 34:49)

So, we're putting everything together but what we're trying to focus on is, it shouldn't reduce the quality. So, at the end of the day, even if you take the one part of a product and compare with the best in the breed, we should perform well. So, I'll give you one example.

So, we are the single company in the world which can help RBI and semi-regulated company in getting compliant with recent certain mandate and RBI mandate. For example, there has been recent circulation like where you have to, you need AI bill of materials, software bill of materials, cryptography bill of materials and we're already working with some of the biggest bank in India. And the things are moving very fast because the problem is what I have seen from my experience that...

[Speaker 1] (34:49 - 34:55)

You still not explain how you're different. Till now, all I've got is we do everything, not just one thing.

[Speaker 4] (34:55 - 36:10)

Okay. So, first what we're trying to focus on are two aspects only. All of the cyber security solutions are focused on some specific technologies.

So, we're first building the technology. Cyber security is one of our application which we will be going very deep. For example, you can break entire industry in two parts.

One is static, what means like what data you're having in your company like it's just there. Another is run time, like how things moves very fast every second or every minute. What we're trying to do is we're trying to go very very deep and understand both aspects with AI or without AI.

Why we do that? Because... Again, digressing too much.

Yeah. What do you do? Okay.

So, we secure end-to-end supply chain of entire company. And how are you different? So, we know the context.

For example, let's say you're thinking about we want to build this specific feature where user wants to purchase something. Okay. But the moment it goes out to the production, 100 engineers coded it, 12 managers got involved.

It went through lot of checklist. Okay. Now, nothing is connected here.

Okay. One security issues could be there and another team will tell we don't take this seriously because this is a false positive. So, we reduce lot of false positives based on the context.

These context gets built because we are very very deeply integrated across the entire stack. That's integration is not available right now in any company. This is the main problem.

[Speaker 1] (36:10 - 36:12)

So, context and integration is your...

[Speaker 4] (36:12 - 36:13)

Yes.

[Speaker 1] (36:13 - 36:14)

Are you live?

[Speaker 4] (36:14 - 36:19)

Yes, we are live. We are already working with some of the biggest FinTech companies in India. We all are using those apps.

[Speaker 1] (36:19 - 36:20)

And you're already getting revenue and all?

[Speaker 4] (36:20 - 37:02)

Yeah, we are already generating revenue also. Good amount of revenue? It's good.

It's pretty good. Within last 5 months we've built pretty good. So, we have right now close to $80,000 and we are working with few banks and we are hoping probably in few months we will hit, we may cross 500k because these deals will be pretty good.

So, we are making revenue but the best part what I'm thinking right now is like we are not focusing on what we are building right now. That's like pretty normal. We are going very deep into the contextual way because that's what I told like the problem with the entire cyber security industry is like The problem with cyber security industry in my opinion is 80% is a scam.

[Speaker 1] (37:04 - 37:06)

Everybody is white labeling the same thing.

[Speaker 4] (37:06 - 38:06)

I understand. So, I will give you one very interesting example. So, there is a famous product in the open source industry and most of the cyber security industry like cyber security company you will see, they all are using that open source product on top of it.

These companies are some of the well known cyber security companies and these are integrated in all top companies in India and US. So, what I did was, I was able to take over that open source component and I was inside every company. All top 500 companies all top 10 companies of India and this was like for 4 hours and no one knew about this one.

So, the point is the industry is very very much dependent on a open source solution which they don't even control. So, the point is, I'm trying to make is like this industry is mostly made by the peoples who are not like from the cyber security background. So, what I want to do is like people should be making a business where they have long experience.

They should face the problem. So, that's why I was working with my last employer.

[Speaker 1] (38:07 - 38:08)

Who was your last employer?

[Speaker 4] (38:08 - 38:12)

So, I was working with Grow before. Why did you quit?

[Speaker 1] (38:13 - 38:14)

They are amazing, lovely guys.

[Speaker 4] (38:14 - 39:03)

So, before joining Grow, I had this discussion with chief of security of Grow and Grow people helped me a lot. So, basically before joining Grow, I was building this idea. I was thinking about this idea and there was a top mate link in his profile.

I just booked a call can you give me the feedback and he told me one thing. Why don't you just understand the problem first hand then build it. So, that's where everything started and I worked for two and half years there.

I scaled their entire AppSec, CloudSec and I understood what problems they are facing and throughout that entire time I gave a lot of training session to thousands of engineers across different countries. So, I understood one thing the most, I will tell like this entire industry is easily solvable only thing is you need right players together to solve this one instead of just making money out of it. Making money is also important but it should be like your by-product.

This is what I think right now.

[Speaker 1] (39:03 - 39:05)

Thank you. Who's next?

[Speaker 11] (39:05 - 39:54)

Hi, I'm Prashant and along with Abhishek, we are building rehabilitation robots to help neuro patients recover independently at their own homes. So, the problem we are solving is that, so there are three main ways in which a neuro patient can get rehabilitation right now. Either he can opt for at home rehabilitation where a physiotherapist comes home, gets 45 minutes of rehab and then he goes back.

The second is you take the patient to the clinic and then get your rehabilitation for two hours or three hours, come back and the third option is you leave the patient at the care facility which is going to cost you two to three lakhs per month. So, this option is not feasible for a lot of stroke patients. The reason is that Indian medical insurance companies, most of them do not cover for stroke rehab.

So, also taking a patient...

[Speaker 1] (39:54 - 40:01)

It feels like half of the problems today are like things I've had experience with recently. Go on.

[Speaker 11] (40:01 - 40:54)

Yeah, so also taking the patient from home to the clinic is a lot of hassle for the caregiver because you need two people first of all and you have to put them in the car, you have to stay with them in the traffic and even when you go to the clinic, you're not really sure if the therapist is available to service the patient. So, the only option which is left, which is financially, it makes sense for a lot of people, is getting the physiotherapist to your house. But in that case, what happens is that they don't have the equipment with them and also a physiotherapist can give 45

minutes max.

After that, he's tired and he has to go back. So, the gold standard for rehab is like 3 hours, but most people are getting just 45 minutes. By having an affordable and portable rehabilitation solution, we are aiming to pump up the number from 45 to 3 hours.

And what does this look like? We do have a demo video.

[Speaker 13] (40:55 - 41:23)

Let me just give you an example. You can flash it on the screen. Yeah, sure.

So, we have a robot of size like bridge height and it has a robotic arm attached to it similar to our hand and that robotic arm holds the patient hand. So, the physiotherapist sets the motion of how to do the rehab process and the machine imitates that exact motion x number of repetitions as per the setting set by the physiotherapist. Thank you.

[Speaker 12] (41:25 - 41:26)

Thanks for the free massage.

[Speaker 1] (41:27 - 41:30)

Very interesting and tell us a little bit more.

[Speaker 13] (41:31 - 41:38)

So, what next? Currently, we are creating a third iteration of our robot. Is it treating anybody already?

[Speaker 11] (41:39 - 41:50)

So, we tested this out on three actual neuro patients but right now we don't have the license yet to put it in a mass manufacture and stuff. Who gives this license? CDSCO.

So, that's the government entity.

[Speaker 1] (41:51 - 41:52)

And what is the company called?

[Speaker 11] (41:52 - 41:53)

Bloom Rehab.

[Speaker 1] (41:54 - 42:06)

Nice. You are the last ones. I thought you guys are together.

Why is that? I don't know.

[Speaker 2] (42:06 - 42:11)

I mean, I've been building stuff since I was 16 years old, 15 years old.

[Speaker 1] (42:11 - 42:14)

Alone all the time? Single child?

[Speaker 2] (42:14 - 42:26)

Yes. So, I've been building stuff and then because I was building it myself and it's hardware. So, I've always been working with machines, electronics.

Usually...

[Speaker 1] (42:26 - 42:27)

What do your parents do?

[Speaker 2] (42:27 - 45:05)

So, my dad works in college where I studied actually. It's in Mumbai. It comes under Mumbai University.

There's a cool story why I chose that college particularly. Because your dad works? Yeah, exactly.

I mean, not because I couldn't get the admission. I cleared my JEE exams and I wanted to do electronics and robotics. After researching on it, I realized in India we produce a lot of software engineers and there's a reason to it because investment per student for a college is like one computer.

You can learn a good amount of programming languages on one computer. And it lasts for 4 years. So, ROI on investment for a college to generate software engineers is pretty high.

But if you take it now, electronics and robotics, you have to provide motors, you have to provide power supplies and they'll probably break because students don't know how to use it. And what happens in this case is college don't promote it. If you see how many things in your home or in your circle, hardware products are made in India.

Electronics. Extremely less. Very less amount of bank will probably pop up right away.

And this is the reason where India doesn't produce a lot of electronics or hardware. Which shaped me to I want to learn electronics and robotics by myself. So, I was getting an IT knack for it, but I had to have attendance.

You had to attend lectures, you had to go and finish assignments and everything. But, my dad he said, if your attendance is less, then call your parents. And my dad was already there, but I didn't go to college.

And studied electronics and robotics myself. So, I'm a self-taught electronics and robotics engineer. My degree is in software.

And I built, so I always work in terms of solving problems. So, I stayed a little bit far from where my college is. College is in Bandra.

So, we had to attend lectures in the morning, 8 am. We had to reach at 7 am station, wake up at almost 6, take a train, and then stand in an auto line, which annoyed me a lot. And at that point of time, I was inspired by this YouTuber called Casey Neistat, who would roam around New York on an electric skateboard.

So, like, I'm an engineer, I should solve this problem, so I made one. I made an electric skateboard. I had a wireless remote in my hand where it was like a ring, where if you move it ahead, it'll go ahead.

And if you pull it back, then it'll break. So, I would roam around Mumbai on an electric skateboard all the time. So, yeah, that is where I earned money.

First time, because I sold the electric skateboard. I made it 35k and then I sold it at 80k. And that was the first amount of money where 16-year-old me was like, oh, you can earn money by doing something that you like.

[Speaker 1] (45:06 - 45:13)

Are you telling me your accomplishments and how hard it has been for you because you're hiding your insecurity or something?

[Speaker 2] (45:13 - 45:27)

A little bit. Of what? I don't know.

I mean, am I good enough to build at a global scale? Something like that. And the money is kind of a validation.

So, I've been building products so that I can validate myself. Oh, people are buying.

[Speaker 1] (45:27 - 45:30)

If that were the case, you would have had a co-founder, right? Somebody you think is smart.

[Speaker 2] (45:31 - 46:10)

The thing is, the objective for a startup, if you see generating money, one of the top things, providing... Why? Why being a solo founder?

I think everything was working. The need to, let's say, I'm bad at sales, so I need a co-founder for sales. Let's say, if I'm bad at building a product, then I need a co-founder to build a technical product.

Somewhere, I think, I had some little bit of skills in everything. I was a good salesman. I could build products myself.

So, I think the need of having a founder, of having a co-founder...

[Speaker 1] (46:10 - 46:16)

Do you feel empathy? Do you feel bad when something bad happens to someone? Yeah.

Deeply? No. Superficially?

[Speaker 2] (46:17 - 46:21)

I mean, I do have empathy, but... You have curiosity? Yes, a lot.

[Speaker 1] (46:23 - 47:04)

My therapist, I was doing a session, and very interesting points came up. We went like first principles into life. What is a human being?

What are values? Are they nature? Is it nurture?

Do we pick what works in the world we live in, and hence, we say we attribute those values to ourselves. And, the one thing we realized is if you don't feel empathy, and you don't have curiosity, like actual curiosity, we all fiend curiosity because it's good in the world we live in. Those are like sure-shot signs of a narcissist.

No empathy, no curiosity. When something bad happens to someone, you're like, yeah, he deserves it.

[Speaker 16] (47:05 - 47:08)

Where did you land on the nature? Was it nurture to be active in something?

[Speaker 1] (47:09 - 48:37)

She asked me, who are you as a person? And I tried to define it. And, we went back into childhood, and we both kind of agreed.

So, me and my therapist are like friends. This is not so much about treating me or fixing something. Not that I don't require it.

I do. But, it's about trying to figure out how we kind of became who we are. And, whenever I've seen a child, kids are very mean.

If I'm a child and I want the ice cream you're eating, I would probably snatch it from you and eat it. So, we're not born with this sense of morality. It is kind of ingrained in us through life because we learn that if I snatch his ice cream, somebody will slap me, and then the next time I should not.

So, nature versus nurture definitely nurture more. But, this is an exercise which is a great thing to do. Like, figure out, go on ChatGPT or Perplexity or Google and say, what are the most popular values, value systems.

And then, try and read each one out. Think about it and attach one to yourself. And then think, am I that way and I resonate with that value because it showed me that I can win in the world that I live in?

Or, is it that I feel deeply about that I'm organically that person? I don't have the answer, but it was just something interesting I'm thinking about.

[Speaker 7] (48:37 - 48:45)

Do you think same for talent as well? Like, is the nature and nurture attribute or it's the naturally someone born with about talent?

[Speaker 1] (48:46 - 50:32)

I don't think there is something to be said about passion. Whatever you think you're really passionate about, say AI girlfriend for example. I'm just saying it because you're sitting next to me.

I feel like there is some unanswered question in your mind about the concept of love, relationship, girlfriend, all of that. That's why you still have a passion towards it. When you truly understand a particular subject, it becomes hard to be passionate about it.

I don't think talent is innate. Let me put it this way. If I had a child, which I do not, and there was a football coaching camp where kids go when they were five years old.

If all the kids are five and I send my child into that coaching camp when the child is seven or seven and a half, by virtue of his physicality, he will start to be better than his peer group from the

very beginning. He will start to believe that he's talented at football and probably grow up to be a talented footballer. But is there something to be said for physical attributes?

Probably, yeah. Some Nigerians have long femur bones so they run marathons better. There is stuff like that.

But I don't make too much of talent, intelligence. I think a lot of this is gathered, collected, inculcated. I don't think anybody is born, not anybody, but most people are not born spectacularly gifted at something.

So we got to your life, but you took too long to come to what your company does.

[Speaker 2] (50:32 - 51:12)

So I bring factories on your desk where I make machines to make electronics at your home, on your desk, where usually, if let's say, I'll give an analogy, if you, now Delhi is very polluted and if you are somebody who wants to make some profit, ideal product to launch at this moment would be air quality sensor. Now, if you had to make it as Nikhil, your ideal goal would be to go to an electronics designer, get the design, case and everything, and then to make it you would ideally have to go to some contract manufacturer to make whatever you design. Now he will tell you that I need 5000 units minimum so that I can make margin on it.

[Speaker 1] (51:12 - 51:17)

So if I call you and I say I want an AQI machine which looks like A, B, C, D, E, you'll make it? No.

[Speaker 2] (51:17 - 51:30)

I don't make the air quality sensor, I don't design the devices, I make the machines to make air quality sensors. So let's say, now your design is ready, with my machine you can make 100, you can make 200, test the waters what are the people saying.

[Speaker 1] (51:30 - 51:31)

What is your machine? Describe it.

[Speaker 2] (51:31 - 52:54)

So, in theory, the technical term is pick and place, where there are green circuit boards, have you seen it ever? On circuit boards there are ICs. So, somebody needs to pick these ICs and place it on the PCBs, printed circuit boards, and then they are cooked in an oven and then you can start using them.

I make the machine which will pick the component, place it on the circuit board and then I make an oven also. And it's all sitting on a small desk, which helps people launch small to mid-scale

production. So if you are a new startup doing a hardware, this is the perfect solution to try your product, rather than having 5000 units and because startups are usually iterating fast and that iteration time goes really less.

For a software engineer, if you are making a website, then you coded HTML code and then you can see the website in the next second. But for an electronics engineer or a hardware developer, you have to send after designing the PCB, you have to send it to the fabricator, who will get the PCB and then you can start at least testing. If the design has a mistake, at that point of time you have to do the whole process again.

So it's like 1-2 months. My goal as a company is to bring that iteration time down to 1 day. Within 1 day, almost matching to software development, you can get the output of your work right away so that overall collective production can be faster.

Iteration could be faster and production also.

[Speaker 1] (52:55 - 52:57)

And what is the company called?

[Speaker 2] (52:57 - 53:01)

PlayStation. Nice. P-L-A-C-E, so pick and place, PlayStation.

[Speaker 23] (53:02 - 53:09)

We used to make smart switches and one of the comments we made and walked into your house was your switch was supposed retrofitted, not done very well.

[Speaker 1] (53:10 - 53:16)

Yeah, so the light doesn't go off in the night, the white light, it's so annoying. Oh.

[Speaker 2] (53:17 - 54:24)

The light on the switch. So basically, how did I come, why did I want to make this machine? The first thing that I started with after college was a smart home start-up where I was doing smart switches and smart lights.

I was making a device that sits behind a switchboard and anything on that switchboard becomes smart. Now I see you love art, right? But the switches are very dull.

They don't look pretty good. But with my devices, you can use any type of switches. The most artistic that you would want to have grab attention and then my device would still sit behind the switchboard and you can use any switches that you want.

The best part is, if your internet is not working, WiFi or whoever you purchased it from stops paying for the server or when they go down, all the switches will stop functioning because it's all over the internet. My start-up was working, everything works without the internet and I'm the only one in India where you can use Siri. You can say, hey Siri, turn off light and it'll do it.

And Google, I don't have my own app. I integrate directly as first-party devices into Google, Alexa, Samsung SmartThings, I see you're using Samsung directly. You don't need my app.

I also don't have my app. Interesting. So, my name is Sahil.

[Speaker 1] (54:24 - 54:26)

You've not said a word today.

[Speaker 9] (54:27 - 54:28)

Yeah. So actually...

[Speaker 1] (54:28 - 54:32)

You know how this works, right? Whoever sees the most viral gets the most sales.

[Speaker 24] (54:34 - 54:34)

Yeah.

[Speaker 1] (54:34 - 54:37)

Attention is equal to virality in this room, right now.

[Speaker 24] (54:37 - 54:37)

Yeah.

[Speaker 1] (54:39 - 54:49)

So think of the most contrarian thing you can think of saying and say it in the next 20 minutes. You have a very nice expression, like your resting face.

[Speaker 15] (54:50 - 54:52)

Oh, me? Yeah.

[Speaker 1] (54:53 - 54:58)

It's a look of circumspection which is like I know.

[Speaker 10] (55:01 - 55:04)

I mean, I'll take it as a compliment, man. It is a compliment.

[Speaker 1] (55:06 - 55:07)

You look wise.

[Speaker 10] (55:09 - 55:12)

Beyond your years. I'm probably the youngest one here.

[Speaker 1] (55:12 - 55:14)

Yeah, you look quite wise, though. You're very settled.

[Speaker 10] (55:15 - 55:15)

Thanks.

[Speaker 1] (55:16 - 55:18)

Doesn't look like you're trying too hard.

[Speaker 10] (55:19 - 55:20)

I never do, so...

[Speaker 1] (55:20 - 55:25)

Yeah. Very settled and composed in your own shoes.

[Speaker 10] (55:26 - 55:27)

That's where I go for.

[Speaker 1] (55:27 - 55:32)

Are you starting to feel awkward about now? No. That's where I'm going to go.

[Speaker 9] (55:33 - 57:41)

I'm building Aya with my co-founder. So we are building Aya where we are making the existing CCTV surveillance into a smart AI security guard. So let's take an example.

So if we have installed a CCTV on the corridor. And let's suppose, in any case, someone falls down and there is no one around him. So what the traditional CCTV surveillance will do, it will just

record the data and that's it.

And you will got to know about it later. But what we actually do, we actually understand the complete context of that video frame and in any case, if there is any kind of emergency, risk or any kind of thing that can harm you in terms of life, in terms of money. So it will create an alert on your mobile application with the context, with the image.

So that you can take action. So our main goal is to reduce the time between the incident has happened and you taking some action. So we are reducing that time so that we can save lives, we can secure the places, we can secure the persons and whatever actually matters to you.

So we initially implemented this idea because of a personal incident to us. So my co-founder, he was working in Bombay 2 years ago. So he lives with his grandmother.

So when he was in Bombay and she was living in Jaipur. So he faced such incident where she fell down by impacting with sofa and he got to know about it later. And then he thought and he discussed with me, like what is the sense of CCTV then?

Then we said and we discussed, alright so let's do it and about our background, so from last 7 to 8 years we were building some good AI products for multiple companies. So this is our main technical expertise in Gen AI and machine learning. So we have built this product.

[Speaker 1] (57:41 - 57:43)

Super. And what is your company called?

[Speaker 9] (57:43 - 57:44)

AI.

[Speaker 1] (57:45 - 57:51)

Nice. So I think we did everybody's story. Is there anything you guys want to talk about?

[Speaker 3] (57:56 - 58:02)

I want to ask, you asked everybody, are you married or not to everyone?

[Speaker 1] (58:02 - 58:04)

I said virality and this is what you meant.

[Speaker 3] (58:05 - 58:39)

So I want to ask, do you think that is one of the factor or maybe indicator or somehow how does that impact the entrepreneurship journey that we are on? Because that is the hot topic in my

family right now. Every dinner table conversation surrounds it.

Like I, for context I come from a very traditional Jat family in Haryana. In that everyone my age is married with a kid in our family. So and I am trying to stay like push that thing like let me do my work.

But you have asked that question to everybody. Do you think that is, maybe with your words I can convince them better?

[Speaker 1] (58:39 - 59:16)

I lived in Haryana you know, 3 years when I was a kid. Karnal. I went to Dayal Singh Public School in Karnal.

I am still in touch with a few people from there. They were quite sweet, thank you. But I don't know the answer to this.

I think generally in life if you live your life based on what other people think you should do, I think eventually you end up at a point when you regret it, at some point. So unless you want to do it, I don't think you should be too fussed about what your society, family or community thinks.

[Speaker 3] (59:16 - 59:21)

Even family like other people say like, oh who cares. But if it's your parents Yeah.

[Speaker 1] (59:22 - 1:00:11)

You know I was thinking about this recently. I am 39 years old. And some friends of mine were like New Years, you should do this, you should do that.

And I was not making any plans. And then while I was thinking about it, at 39 an average Indian lives to 73. I probably have 34 New Years left.

In 34 New Years I probably have 20 of them where I'll be too old to do the things I can do today. So practically I don't have that many December 31st left in my life. You know, good ones in the manner that I perceive good today.

I only probably have like 10 if I were to be pushing it.

[Speaker 3] (1:00:11 - 1:00:17)

Maybe more since you do keep check of your health. Yeah. Compared to average Yeah.

[Speaker 1] (1:00:18 - 1:00:38)

And when we have so little time, you have a bit more than I but it feels stupid to do things

because others want us to do it. Because our time is very finite. We never think about it that way but we are not going to live forever.

Nobody is.

[Speaker 6] (1:00:38 - 1:01:12)

And do you also think that relationship in general is tricky for entrepreneurs? Entrepreneurs think very differently. I can see a very different version of this world which a lot of people cannot see.

So when things start in a relationship, they are fine. Okay, I can understand you're busy and things. But you want to see that world and you have limited time, you know that.

And then once that understanding fades away and it becomes difficult. You've seen a lot of entrepreneurs successfully getting divorced, stuff like that. So do you think it's tricky?

Also being said, if both of you are not growing or say not that ambitious.

[Speaker 1] (1:01:14 - 1:02:22)

I think not just for entrepreneurs but the concept of relationship is also very transient. Our notion of marriage is very much programmed by the media we consumed as children and what we saw around us. And the way Bollywood and Hollywood has depicted the idealistic version of romance.

I mean it might be attainable in the short term but I don't know how sustainable it is. That kick of whatever dopamine, oxytocin kind of like fades with a certain amount of time. And you're left questioning why is it not like it was in the movie.

So I think all of this will change. Don't go by I am no body to give a prophecy about this. I have not successfully manifested any of this.

But I would say make these decisions which feel right to you and not what other people think are right for you.

[Speaker 6] (1:02:23 - 1:02:45)

And do you also think momentarily it might feel right but I feel like the most important thing one should focus on long term is growth. If you stop growing in a relationship. Overall like emotional it can be professional wise you feel energized.

You feel positive when you're around that person. I think that is what is key to a successful relationship.

[Speaker 14] (1:02:45 - 1:02:49)

So the million dollar question is what are your new year plans?

[Speaker 1] (1:02:50 - 1:02:51)

No nothing.

[Speaker 4] (1:02:51 - 1:02:52)

That's the plan.

[Speaker 14] (1:02:53 - 1:02:53)

Nothing.

[Speaker 1] (1:02:54 - 1:03:05)

You know my plan right now is to be able to sit here at home, stare at the trees, do nothing. That plan of doing nothing is the plan.

[Speaker 4] (1:03:06 - 1:03:16)

And if I tell these to my friends, they will be mad at me. Because I always have these kind of plans since my childhood. But everyone will tell you you are wasting your life.

Same happened in the college days.

[Speaker 1] (1:03:16 - 1:04:03)

Yeah. In a way to your earlier question even if you think or for you even if you think marriage is good now, marriage is bad tomorrow. Even if you get married, change your mind.

Don't get married. One day you regret not being married. I feel like society has wrongly coined hypocrisy as a bad word.

Hypocrisy and change are synonymous in a way. I feel like it shouldn't be looked bad about. Like if you believe in something today and you believe in a completely different thing tomorrow, you should change and not give a f**k about who is going to say what and hold you accountable to what.

Like maybe you don't believe in marriage today or you do. Maybe you got married too early and you want to change your mind in a year.

[Speaker 24] (1:04:04 - 1:04:06)

Don't be too hard on yourself.

[Speaker 1] (1:04:08 - 1:04:10)

That's the first year of the hardest.

[Speaker 10] (1:04:11 - 1:04:12)

Realizing that.

[Speaker 1] (1:04:14 - 1:04:25)

Is there a reason why you have an AI and not a real girlfriend? Did you ever have a real girlfriend? Is that an introspection?

Is there a fear associated with dating a real person?

[Speaker 7] (1:04:26 - 1:04:54)

I mean, the starting phase I've never had. I mean, I never could take it more ahead. Like in the initial phase, I was not really thinking.

Online, a person is good. But when I met that person, it was not whom I wanted them to be. So, it never really worked out.

Also, I like being alone by myself. So, last two months, I only got out of my room four times. For two months, I was logged in.

[Speaker 1] (1:04:55 - 1:04:56)

I feel you. I like that.

[Speaker 7] (1:04:58 - 1:05:10)

So, for that, I felt like I need something which is in my context and something I can maybe engineer for now. So, maybe that.

[Speaker 1] (1:05:10 - 1:05:23)

No, but I feel him 100%. I've never been on a dating app and stuff like that and I'm petrified of dating. Like the whole point of going on a date and trying to impress the other person.

[Speaker 24] (1:05:23 - 1:05:24)

Such a performative app.

[Speaker 1] (1:05:24 - 1:05:27)

Yeah. It doesn't seem like a fun experience.

[Speaker 10] (1:05:27 - 1:05:29)

I mean, if you still have to impress, then what are we doing?

[Speaker 1] (1:05:30 - 1:05:37)

But it's all relative, no? It sucks the energy, basically. We can talk about something else.

This is like, let's talk about...

[Speaker 4] (1:05:37 - 1:05:48)

I have one follow-up question I wanted to ask. You were talking about being narcissistic. I want to ask, is narcissism, according to you, is being narcissistic really bad?

I want to ask.

[Speaker 1] (1:05:49 - 1:05:59)

So, narcissism is a deeper concept than that. I think it's a symptom of a disease. We are not born narcissistic, per se.

[Speaker 3] (1:05:59 - 1:06:01)

Do you think narcissists are usually self-aware?

[Speaker 1] (1:06:01 - 1:06:54)

Do you know your worth? No, I don't think so. Rarely.

See, there are two schools of psychology. One believes that you can't change who you are. Everything is about figuring out why you are who you are.

I think everyone from Freud, Jung, they all fall in that school. There's another school that it's not just about figuring out who you are, but how to change your tomorrow. I don't know if I'm right, but I think Adler, a bunch of psychologists are in that school of thought.

I don't know where I sit. I enjoy reading both schools of thought. I feel like you have to go through the former school and first understand why you became who you became before you can reach the latter school.

I don't think I'm even at that point before the starting line.

[Speaker 5] (1:06:55 - 1:06:59)

What part of Jungian psychology do you like particularly the most?

[Speaker 1] (1:07:03 - 1:07:51)

Whenever he speaks about shadow traits and how your shadow traits become darker when you don't recognize them, I have found myself catching some of my shadow traits at times. And it's actually very similar to some Indian philosophy, anthropology as well where if I'm greedy, I can never change the fact that I'm greedy. But maybe the point is not to try and change that I'm greedy, but if I take cognizance of the fact that I'm greedy, that in itself changes my behavior.

Because then I'm dealing with a new situation with the awareness that I'm greedy. It's kind of interesting.

[Speaker 12] (1:07:53 - 1:08:09)

These guys actually did a whole exercise where they filled a quiz and they got like 36 strengths and their 34 strengths were ranked and which they'll be using to run their business. Like if they lean more into their five top talents, they'll be serving them better.

[Speaker 3] (1:08:09 - 1:08:26)

Whole personality analysis they did, who's more futuristic, who's more competitive. He was competitive, that was his first trait. And they're like, lean into that.

You have this, then lean into it. Rather than averaging your weaknesses, it's the strength which will propel you.

[Speaker 7] (1:08:26 - 1:08:27)

Do you celebrate your birthday?

[Speaker 1] (1:08:28 - 1:09:25)

Yeah, every year on my birthday we have this big summit where we call who we think are the smartest, most relevant people under the age of 45. Across the creative field, industry, journalism, a bunch of different industries. We book a big fancy place.

100 people sit and have debates. There are no cameras allowed. We block everybody's cell phone when they enter the room.

And it's a fun day of what I believe are 150 of the smartest people in India getting together and having conversations about things we are otherwise scared to talk about. I love this light in Goa. Half the time I'm here, the thing I love doing is watching the sunset.

Especially if you go to the beach at this time, it becomes like orangish, then pinkish.

[Speaker 15] (1:09:25 - 1:09:26)

We were there yesterday.

[Speaker 1] (1:09:26 - 1:09:40)

It's lovely, right? Do you spot birds? Today morning I had this bird which is this high, blue colour with some yellow wings making like a really loud cackling noise.

Like it's laughing.

[Speaker 5] (1:09:41 - 1:09:48)

Are you also into photography? No. Would be a nice place to do it.

Do you like watching stars?

[Speaker 7] (1:09:49 - 1:09:51)

Yeah. Are you into it?

[Speaker 9] (1:09:53 - 1:09:57)

This specific time is also known as golden time period.

[Speaker 1] (1:09:57 - 1:09:58)

Yeah, golden hour, right?

[Speaker 9] (1:09:58 - 1:10:10)

So if you ever happen to catch, so there is a straight highway of 90 km where you can actually see the reflection of the sun and the sun as well in the sunset time.

[Speaker 3] (1:10:10 - 1:10:53)

Nice. I have a request, Nikhil. Like you bring to your podcast like probably titans of all different things with Yan, Elon, Sam, everything and you have sort of covered the fintech, tech, all these industries.

What I think next, it's just a request though, maybe you can bring someone from tech, bio, biotech. Yeah, because I feel like biology is just huddled as a very unsexy, unglamorous thing, especially in India and you bringing that platform would really, and there is such tremendous exciting work going on. Maybe Demis from Google DeepMind.

Maybe the brilliant people.

[Speaker 1] (1:10:53 - 1:11:02)

We were actually planning some bio, we were thinking actually not just biotech but some pharma,

diagnostic companies.

[Speaker 3] (1:11:02 - 1:11:22)

Exactly, the window it will provide to the and most of your viewers are very young and they are excited about all those things and I think biology is coming of the age right now with CRISPR-Cas9, everything and so you bringing that platform and also it's my personal, if you bring Demis, he'll be in there, I'll be able to catch him.

[Speaker 10] (1:11:22 - 1:11:28)

Yeah, if we call him, we'll call you. What's your take on the longevity space since you're buying a womb?

[Speaker 1] (1:11:32 - 1:11:47)

I'm into all the fads, I don't know if they'll work, I think time will tell but I do take a bunch of supplements, I do cold plunge, sauna, workout, all these things everyday.

[Speaker 12] (1:11:48 - 1:12:00)

Actually, if you don't believe in legacy, why do you believe in longevity? If I don't believe in? Legacy, why do you believe in longevity?

Because then if you don't believe in legacy you could maybe go tomorrow and if it's inevitable then why do it?

[Speaker 1] (1:12:00 - 1:12:36)

I think legacy is for others, longevity is for myself because if the quality of my life 10 years from now can be better in the manner that I can still play paddle everyday for 2 hours I would really enjoy that. Legacy is more for others, I don't care so much about Do you care about what people will think after you're gone? Not really Nobody will think I think you'll think for like 5 years, 10 years max How much of AI do you use in your life?

[Speaker 20] (1:12:36 - 1:12:44)

Not that much Little bit Not that much In trading? Not that much I feel like

[Speaker 1] (1:12:47 - 1:13:07)

trading is not subject to anything which is fundamentally sound it is a lot of emotion, as long as emotion can't be modeled for, it will be tough for AI to make better calls than a human being

[Speaker 5] (1:13:07 - 1:13:12)

So you're more of a data oriented trader, like you're more into emotions and how people behave

[Speaker 1] (1:13:12 - 1:13:56)

I used to be a trader, now as I've become slower with age I'm no longer really a trader I tend to take more cyclical calls on the market, like I would buy a particular like we all, Suchet Vivek, Arshia and a team of mine called Namans team, for the lack of a better word, we've been doing sector thesis of all the sectors and trying to narrow down on which sector we think will have the highest growth in the next 10 years We've spent a lot of time on it more time than we should have I think the better part of this

[Speaker 9] (1:13:56 - 1:13:58)

So what sector do you think will grow?

[Speaker 1] (1:13:58 - 1:14:48)

The better part of this year has gone on that Once we arrive at that exercise ka solution we will allocate capital to those sectors that we think are up there. What are we what is leading right now? Probably energy transition Energy transition has been a big part of our thing.

We did last year a whole bunch of solar panel companies battery companies electric vehicles we're looking at some grid some companies which improve transformers, make the grid more efficient new sources of energy We've been working in the energy energy transition for the last one year That's one of the sectors we liked I don't think that's going away Whatever happens, AI, no AI

[Speaker 3] (1:14:48 - 1:14:53)

AI will need compute and power Every government is now trying to have their nuclear reactors

[Speaker 1] (1:14:53 - 1:14:57)

It'll get a lot more efficient though, the amount of compute that's used.

[Speaker 2] (1:14:57 - 1:15:20)

Do you think the world will stabilize quite a lot once the energy is in abundance? Like let's say if we fix the nuclear fission part of it at that point of time if energy is so abundant the value people derive from would eventually come down to creativity like how do they represent their thoughts like if they have something to express at that point of time that would be the only thing that they would want to say

[Speaker 1] (1:15:21 - 1:15:58)

Creativity is interesting If you were to define creativity as a contrarian thought against the trend one can extrapolate that AI can be thought to be contrarian as well Maybe being contrarian to the contrarian and constantly being contrarian becomes creativity So how often you change your mind about something becomes why you're valuable or taste in a manner And it has to be very dynamic and transient But these are such far-fetched scenarios, there's no right or wrong answer in any of these

[Speaker 5] (1:15:58 - 1:16:13)

But I think so, a lot of world's instability is not just because of energy, sometimes it's just normal human emotions Some people at the top who are insecure about something or maybe someone who just needs a Nobel Prize So it could be that as well

[Speaker 12] (1:16:14 - 1:16:28)

Actually one thing about truth is we think it's always useful, but actually there are certain lies we need to believe in to actually function. For example, life inherently is meaningless, that's the truth But if you believe it has meaning and that's a lie you actually believe, then you can actually do a great thing.

[Speaker 3] (1:16:28 - 1:16:32)

Tell stories to ourselves about ourselves and then motivate

[Speaker 1] (1:16:32 - 1:17:41)

The one thing you all should totally spend time on is to become better storytellers If you can do a course in storytelling I sucked at it, not that I'm great at it today, but I got a speech coach a few years ago And we went about He's a pain in the ass, but he's also brilliant He'll make me sit and he'll give me a book take away my phones and devices and say write And he makes me write for 3 hours, 2 and half hours without a break And if you ask him what should I write about, he'll say anything You should do that on Twitter You have to kind of figure out how to build a character A story needs to have a beginning, a middle a twist, a call to action.

Anti-hero, a climax something which forces And that holds true when you describe your companies. Because whenever I ask you can you say it in one line If you can't appeal to me in that one line, tomorrow when you sell it that's the same line you're going to use It's time well spent, doesn't cost a lot of money There's enough material online on storytelling.

[Speaker 3] (1:17:42 - 1:17:43)

Who's the guy that you trained with?

[Speaker 1] (1:17:43 - 1:18:02)

His name is Michael, he's an Israeli guy He teaches a lot of US politicians He flies down, lives with me for a week and then he goes back Is he on Udemy? His company is called Virtuoso If you want to look him up

[Speaker 18] (1:18:04 - 1:18:08)

What are some other skills you think

[Speaker 20] (1:18:08 - 1:18:09)

we should

[Speaker 1] (1:18:09 - 1:19:09)

You will, as founders of companies have to negotiate a lot Cap tables, fundraisers contracts To become better negotiators is probably useful This is again something I learnt or I think I learnt through experience but people don't often disagree with ideas, they disagree with people When you guys are here today you came with a preconceived notion that either you like me or you dislike me you're going to agree with me or disagree with me To figure out who wants to agree with you and who disagrees with you before you negotiate with them is important Because if you're dealing with somebody who wants to say your business is shit You should project circumspection when you're talking about your business

[Speaker 3] (1:19:10 - 1:19:14)

Like him Like him you said he has that trait locked in

[Speaker 1] (1:19:14 - 1:19:37)

He has this particular expression where he's like impress me which is opportune for the place he's sitting in right now I mean that might be coincidental but I think in your negotiations you have to figure out which seat you're on and who's on the other seat and appeal to what appeals to them

[Speaker 5] (1:19:37 - 1:19:45)

I think so you're pretty much into philosophy, do you also read Krishnamoorthy?

Have you been to his study centre and all?

[Speaker 1] (1:19:45 - 1:19:59)

Yeah, my nephew goes to his school Oh wow amazing He never wrote anything so there's no more written version of his philosophy but I've read his speeches Yeah, there was one Does God exist or not?

[Speaker 8] (1:20:00 - 1:20:06)

He says you're in a jungle What would be your idealistic society according to him?

[Speaker 1] (1:20:07 - 1:20:18)

My God Zero envy would solve all the problems But how do you enforce?

[Speaker 2] (1:20:19 - 1:20:35)

How do you enforce that? If you're thinking idealistic society then in that case the society, if there's no envy you're just living your own life, interacting with resources that you have But it's a brain chip to enforce that thing

[Speaker 8] (1:20:35 - 1:20:36)

that's what I'm saying

[Speaker 2] (1:20:36 - 1:20:41)

On a philosophical level that would be the ideal society

[Speaker 8] (1:20:41 - 1:20:43)

Sure, but it's not realistic

[Speaker 1] (1:20:43 - 1:20:59)

I think societies are happy when the trend of relative change is upward It doesn't matter if you have a lot more than me as long as next year I have more than I have today

[Speaker 8] (1:21:01 - 1:21:02)

What's the competition?

[Speaker 1] (1:21:02 - 1:21:37)

Competition with self It's a competition with self as well as a competition with you but a society which is able to orchestrate small wage growth every year which is probably on par with asset price growth you're getting richer at the same pace as I'm getting richer will probably do well. I feel like right now the world is surviving on capitalism till there is growth. I think the minute you take that growth away things become crazy I have a question on that.

[Speaker 5] (1:21:37 - 1:21:58)

You said a lot of societies who have a higher change of growth, they're happy A lot of happiness

index, largely there are European countries who are up on the chart, but right now if we see, most of them are not actually growing to that extent They're slower, stagnant There's some study, community There's some Harvard study which lasted 100 years You guys read that?

[Speaker 1] (1:21:58 - 1:22:34)

On happiness? Sense of community Sense of purpose, all of that I don't know though So Veritasium video Watch Veritasium That video They make good videos This guy, Johnny Harris, have you seen? I think he does a good job with videos He made something on Taiwan, I was watching it Quite good, very in-depth You said Casey Neistat, right?

I used to like Casey Neistat a lot But that's not learning, it's more like blogging, right? True, just blogging his own life You get to see how New York is

[Speaker 2] (1:22:36 - 1:22:53)

There is a very clear distinct between how he does storytelling which is extremely engaging with other people where you see that they're making efforts to engage where Casey is just natural flow of the engagement You don't have to put an effort but the video ends

[Speaker 1] (1:22:57 - 1:23:05)

Nice So this was fun I hope you guys enjoyed your trip to Goa

[Speaker 9] (1:23:05 - 1:23:14)

What do you think as early stage founder that you when you were in your early stage, when you were founding

[Speaker 1] (1:23:14 - 1:23:16)

Thank you for calling me old

[Speaker 9] (1:23:18 - 1:23:28)

I didn't mean that I am though, so it's okay So what are the things that you actually cared about but now you think that was not that much important

[Speaker 1] (1:23:32 - 1:23:57)

Early, what do you care about? Money, right? Yeah, first thing And it is important Think of the world as a game of monopoly You need to have chips to play And the more chips you have the more fun it is to play People say it's not important but it is Done?

Super, thank you guys I think we spoke for much longer than we thought we would
